Department of Civil Engineering, University of Salerno, Italy

A preliminary comparison between the response spectra evaluated at close source for L’Aquila earthquake (data 06/04/2009 – 1.32AM UTC – Magnitude 5.8) and the elastic demand spectra according to the new seismic Italian code (NTC2008) are herein presented for ordinary (reference period $V_R=50$ yrs) and strategic constructions (reference period $V_R=200$ yrs).

To this end, the following horizontal corrected components (1), recorded for epicentral distance lower than 10 km, have been considered:

- FA030 – station AQG, site Colle dei Grilli
  Soil profile type B, Topography factor ST=1,1
- GX066 – station AQV, site Aterno Valley
  Soil profile type B, Topography factor ST=1,0
- AM043 – station AQK, site Aquila Parking
  Soil profile type C, Topography factor ST=1,1
- CU104 – station AQA, site Aterno River
  Soil profile type B, Topography factor ST=1,0

Soil parameters have been preliminary estimated by data available from ITACA database (2) on accelerometric RAN network (3) and from geographic database available from Regione Abruzzo (4).

The earthquake response spectra, for both the horizontal direction $S_{ax}$ and $S_{ay}$, have been carried out by considering 5% damping coefficient and logarithmic subdivision of the considered period range. The obtained spectra have been compared with the elastic demand spectra according to the new seismic Italian code (NTC2008), as follows:

<table>
<thead>
<tr>
<th>Target Performance Levels</th>
<th>Return Period $T_R$ [yrs]</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Ordinary Constructions</td>
</tr>
<tr>
<td></td>
<td>($V_{R}=50$ yrs)</td>
</tr>
<tr>
<td>Immediate Operative (SLO)</td>
<td>30</td>
</tr>
<tr>
<td>Damage Control (SLD)</td>
<td>50</td>
</tr>
<tr>
<td>Life Safety (SLV)</td>
<td>475</td>
</tr>
<tr>
<td>Collapse Prevention (SLC)</td>
<td>975</td>
</tr>
</tbody>
</table>

In particular, for each target performance level, the elastic demand spectra for soils type A, B and C have been considered.
